

Protein Data Bank: the single global archive for 3D macromolecular structure data

Genji Kurisu

Institute for Protein Research, The University of Osaka, 3-2 Yamadaoka, Suita, Osaka 565-0871, Japan

The Protein Data Bank (PDB) is the single global archive of atomic-level, three-dimensional structures of biological macromolecules determined experimentally. The archive is maintained as a global public good by the wwPDB, an international organization established in 2003 by three founding partners: RCSB PDB, PDBe, and PDBj. Subsequently, the BMRB and the EMDB joined as method-focused data centers in 2006 and 2021, respectively. In 2022, PDBe became the first Associate Member. All partners adhere to the FAIR principles, ensuring that archived data are freely available under the CC0 1.0 Universal License. Now we are also advancing efforts to establish a federated archive framework for coordinating with pertinent data resources, including, for example, SASBDB and PRIDE that are relevant to archiving of complex macromolecular structures determined using integrative or hybrid methods.
