

Misa Minegishi is an Assistant Professor at the Laboratory of Nano-Bioengineering, Institute for Life and Medical Sciences, Kyoto University. She received her Ph.D. in Engineering from Tokyo Institute of Technology in 2022, where she studied cell-cell interactions in metastatic niches. Following postdoctoral training at RIKEN as a JSPS Research Fellow, she joined Kyoto University in 2024. Her research focuses on developing novel engineering tools to investigate how cancer cells interact with surrounding cells and their mechanical environment, with particular emphasis on capturing temporal dynamics of these interactions. Her work integrates microengineering, molecular biology, and biophysics to uncover how physical forces shape cancer cell fate over time. She has received several awards, including the Ohbu Award (Research Encouragement Award) from RIKEN (2024) and the Young Investigator Invited Talk Award from the Biophysical Society of Japan (2024).
