

Dr. Hojung Nam is a Professor in the Department of Pharmacy at Yonsei University, where she directs the Bioinformatics and Intelligence Laboratory. Her research centers on machine learning and deep learning for AI-based drug discovery. Her group has developed generative frameworks for molecular design, deep learning models for cardiotoxicity, in vivo toxicity, and synergistic drug combination prediction, and knowledge-graph and multi-omics approaches for target and synthetic lethality discovery. More recently, her work has extended to emerging drug modalities, including RNA-targeting small molecules and language-model- and reinforcement-learning-based design of peptides. She received her Ph.D. in Bio and Brain Engineering from KAIST and completed postdoctoral training in systems biology at the University of California, San Diego. Before joining Yonsei, she was a Professor in the Department of Electrical Engineering and Computer Science at GIST.
