

Dr. Cheng Tan is a Research Scientist in the Computational Biophysics Research Team at the RIKEN Center for Computational Science (R-CCS). He received his PhD from Nanjing University, followed by postdoctoral work at Kyoto University with Prof. Shoji Takada before joining RIKEN with Prof. Yuji Sugita.

His research focuses on developing advanced coarse-grained (CG) models and implementing high-performance simulation algorithms for modern CPU and GPU architectures. He actively applies these computational tools to investigate large-scale biological systems and functional mechanisms, including protein–DNA interactions and the regulation of biomolecular condensates. He is also a core developer of the GENESIS software package, working on accelerating MD simulations for large biomolecular complexes. He has published extensively on biomolecular dynamics, multiscale modeling, and high-performance computing, and received the Young Scientist Award from the Protein Science Society of Japan in 2025.
