

Miho Yanagisawa received her Ph.D. in Physics from Ochanomizu University in 2009, where she studied phase separation in lipid membranes. She subsequently worked as a JSPS Postdoctoral Fellow at Kyoto University and joined Kyushu University as an Assistant Professor. In 2014, she became an Associate Professor at Tokyo University of Agriculture and Technology, and in 2019, she moved to the University of Tokyo. Her research focuses on the physics of soft matter and cell-sized systems, particularly how lipid membranes, interfaces, and confinement regulate the organization, phase behavior, and mechanics of biomolecular systems. By combining physical approaches with synthetic-cell and membrane-based model systems, her work aims to uncover physical principles underlying the organization and emergent properties of living cells and tissues. She received the Michèle Auger Award for Young Scientists' Independent Research 2022 from Biophysical Reviews (Springer Nature) in recognition of her research contributions.
