

Song Yang is a young faculty member at the School of Medicine, Fuzhou University, China. He received his Ph.D. from the Academy for Advanced Interdisciplinary Studies, Peking University, in 2024, under the supervision of Prof. Chen Song, and then joined Fuzhou University. His research focuses on the molecular mechanisms of protein conformational transitions and protein–lipid interactions, using all-atom and coarse-grained molecular dynamics simulations. He has developed the Switching and Multiple-basin Gō-Martini methods, together with the open-source Python package CTGoMartini, and applied them to membrane transporters and mechanosensitive ion channels, aiming to elucidate how membrane proteins function and how their activities are regulated by the surrounding lipid environment. His work provides computational tools for studying membrane protein dynamics in realistic lipid environments.
