

Yongchan Lee, Ph.D., is an Assistant Professor at the Graduate School of Medical Life Science, Yokohama City University, Japan. His research focuses on structural biology of membrane proteins, with particular interests in nutrient transporters and heteromeric membrane protein complexes. He combines electron cryo-microscopy, biochemical techniques and structure prediction to discover and characterize previously unrecognized membrane protein assemblies. His work has been recognized with a Young Scientist Award from the Protein Science Society of Japan, a Human Frontier Science Program (HFSP) Long-Term Fellowship, and a JST PRESTO research grant.
