

Dr. Zhu obtained his PhD in computational chemistry from the University of Amsterdam. He went to the Hong Kong University of Science and Technology in 2012 for postdoctoral research, focusing on the integration of enhanced sampling algorithms with Markov State Models. He then joined the Warshel Institute for Computational Biology at the Chinese University of Hong Kong, Shenzhen in 2018 and is now a tenured associate professor there.

Dr. Zhu has long been dedicated to the integration of enhanced sampling algorithms with AI approaches and its application in biomolecular design. His research interests include the development of automated path-searching methods, new dimensionality reduction and sampling algorithms, rational design of agonist, allosteric modulator, proximity-inducing drugs, and complex industrial/tool enzymes. He has published over 60 papers on journals including NSMB, Nat Commun, JACS, PNAS, JCTC, Cell Discov. and Phys Rev Lett.

Based on the algorithms developed over the past eight years, Dr. Zhu is now constructing an intelligent kinetics computing platform that enables the systematic supply of mechanistic data about biomolecular interactions for bio-AI of the next-generation.
