

Han received her B.S. in Chemistry from Seoul National University, Korea, graduating summa cum laude as valedictorian. She earned her Ph.D. in Physical Chemistry at MIT as a Samsung and KASF fellow, under the guidance of Prof. Mounji G. Bawendi (2023 Nobel Laureate in Chemistry), where she developed quantum dot-based intravital imaging platforms. She then joined Prof. David Weitz's laboratory at Harvard as a postdoctoral researcher, developing droplet-microfluidic platforms for high-throughput genome sequencing. Han is currently the Mark A. Pytosh Scholar and Associate Professor of Chemistry at the University of Illinois Urbana-Champaign. Her research group develops experimental and computational platforms at the intersection of chemistry, biophysics, and systems biology, integrating microfluidics and multiplexed imaging to uncover the organizational principles of complex biological systems. She has been recognized with the Johnson & Johnson WiSTEM2D Award for Science and the NIH Maximizing Investigator Research Award, serves on the Early Career Board of *Analytical Chemistry*, and was a keynote speaker at the inaugural Atlanta Workshop for Single-Cell Omics.
